Introduction

Keeping our fundamental brand elements and eco-conceiving them to propose greener, cheaper and more inclusive communication, that's the Eco-branding challenge. In this way, we limit our consumption of ink, paper and energy all while reinforcing our visual impact.

Beyond the Eco-branding approach, all Group entities are committed to reducing its environmental footprint.

brand.orange.com

This document outlines our Eco-branding position.

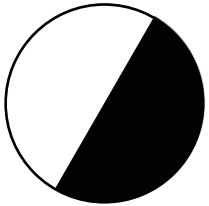

For more guidance regarding the application of the Orange identity, please visit the brand.orange.com or contact a member of the Global Brand team.

Brand Basics

For more on how to use each of these elements, visit our brand site - brand.orange.com

Logo
Always use original artwork.

Eco-branding
White for print. Dark for digital.

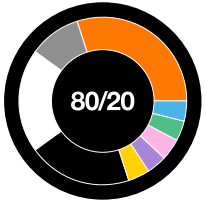

Personality
To make our brand coherent and unique.

Brand voice
Simplify to the essential, always write with a smile.

Naming
Generic, descriptive or hero, respecting spelling rules.

Color
Min. 80% core color; min. 30% orange; max. 20% supporting color.

Typography
Bold, direct, essential.

Photography
Natural and within listening distance.

Illustration
Linked to our personality, always flat, bold and simple, never dull.

Mix
An interaction between the photo and the illustration to highlight the brand role.

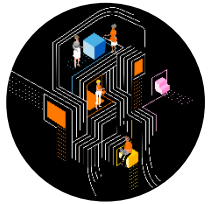

Film and animation
Personalized and emotional demonstration.

Music and sound
One sonic logo and a coherent musical territory.

Icons and stickers
Black, white or orange; always use original artwork.

Digital
Download guidance, tools and assets at design.orange.com

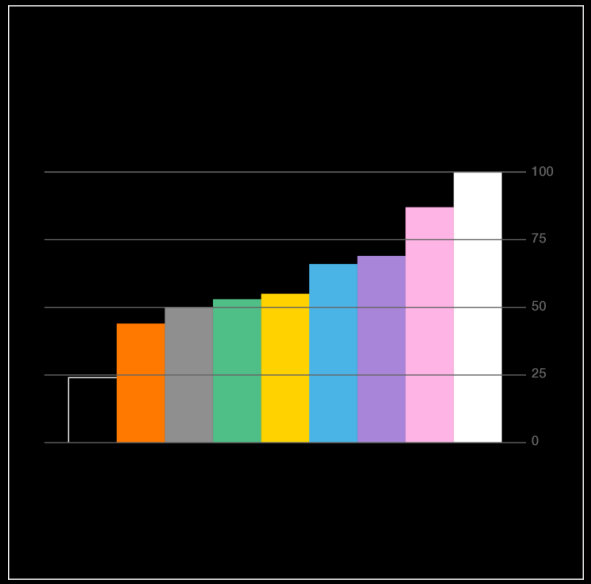

Orange Restricted

Screen

Dark is Light

Dark mode is spread across all digital platforms and is becoming the default theme for new phones. From system interfaces to smartphone apps, as well as online services, a darker theme is being used allowing for a reduction in energy consumption and as a result less battery use.

We recommend using Dark Mode which allows you to save almost 60% in energy consumption depending on the interface and user settings.

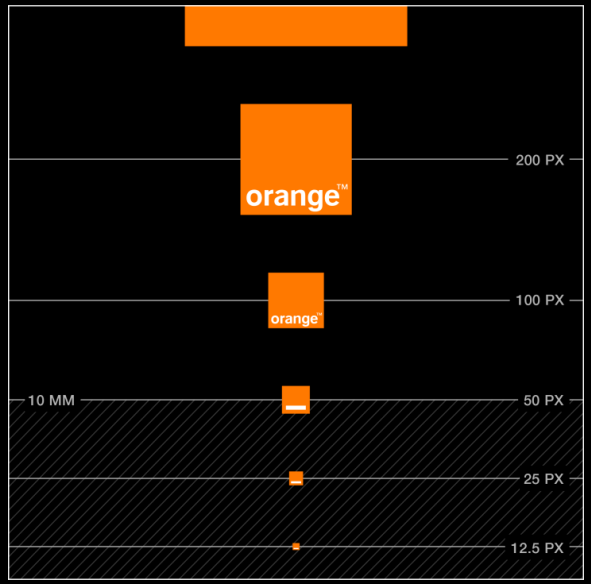

Colours' energy consumption on an OLED screen

The Small logo

To optimise our logo's readability on small digital platforms, our Master logo can be adjusted and becomes the Small logo.

We use the Small logo up to 50 pixels or 10 mm.

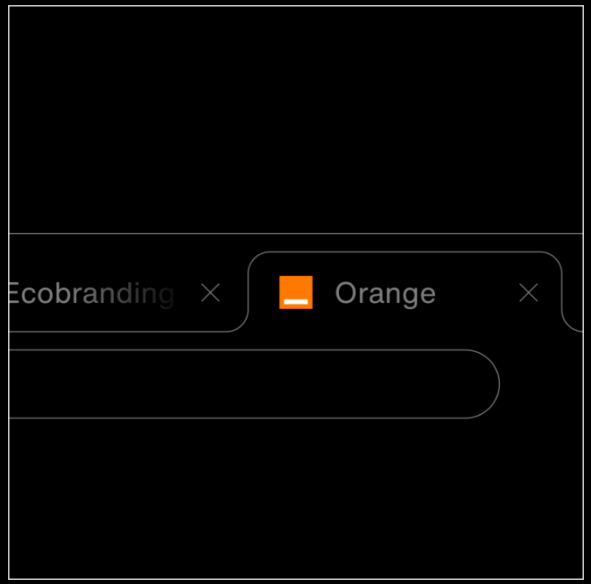

Small logo: up to 50px/10mm

Small but powerful

Below a certain size, the Small logo is used digitally because it is more visible, more recognisable and uses less energy.

It also allows for a reduction of the file size of the logo by lightening the data size by 56%.

Small logo file size: - 56% KB

A greener font

On a website, for each character type (Regular, Bold…), you have to download a new file which makes the site heavier and uses more energy.

Helvetica Now (coming soon) is a variable font that combines Regular and Bold together in a single font file. This lightens the website considerably, increases the load speed of pages and consumes less energy.

Also the space required for each letter has been reduced which makes for shorter pages (both on webpages and in print.)

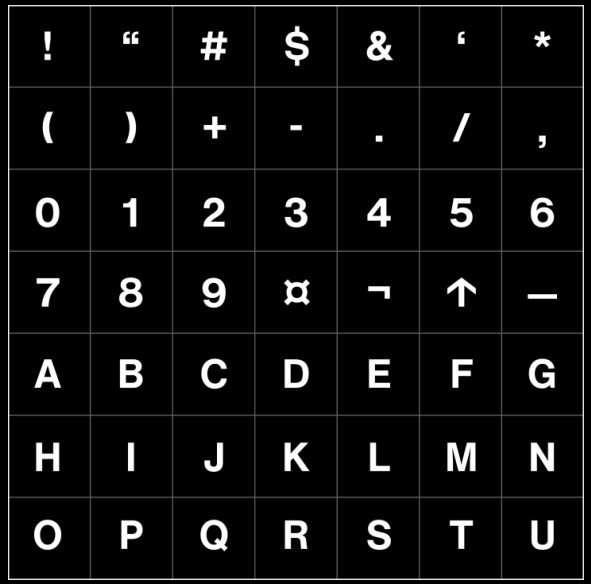

File size of the typeface: - 50% KB

Just what you need

A glyph is a typographic sign. Some glyphs are essential, like capitals or punctuation, while others are secondary.

Reducing the number of glyphs to the essential characters decreases the typeface file size and as a result energy use during page loading on a screen.

Reduction of glyphs

More with less

Our illustrations have to be simple and sleek to be light and visually powerful. And so, the time for pages to load is reduced, along with energy use. We give preference to flat tints and avoid corrupted and blurry images, conveniently, they are banned by our codes.

All illustrations on the brand site have been created with black background for digital and white background for print.

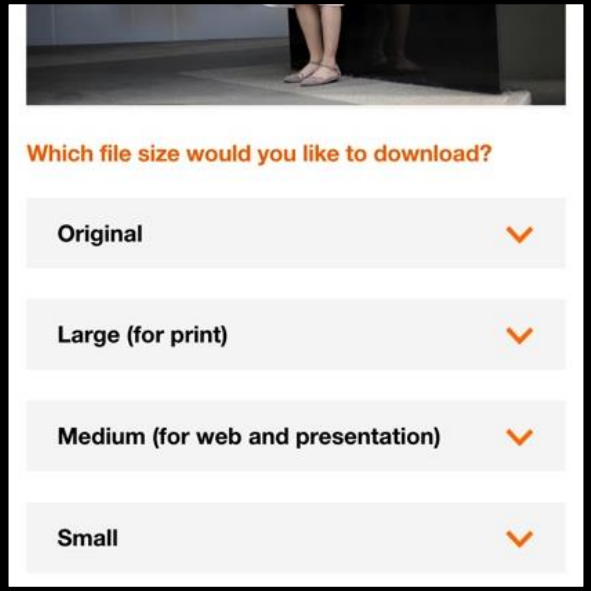

Quick load illustration

Long live lightness

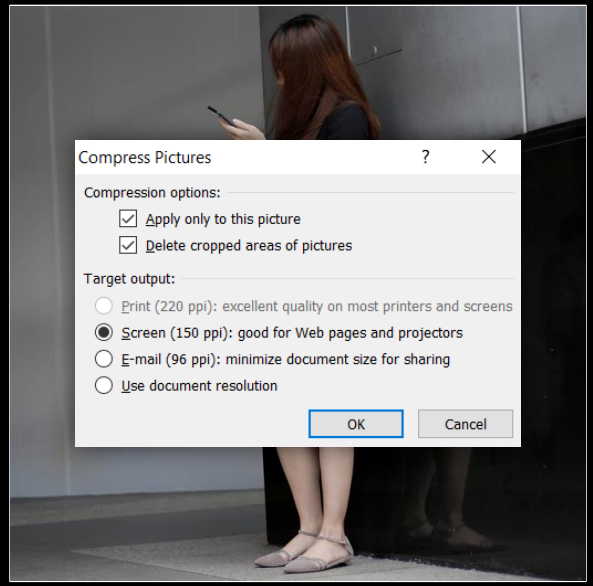

Whether they’re used for display, storage or sharing, the use of photos in digital contributes towards the environmental impact.

This is why on our Brand site we have 4 options and encourage users to download the correct size appropriate for the usage.

Long live lightness

Likewise in presentation software such as PowerPoint, you can reduce considerably the weight of the file by using the built-in compression feature.

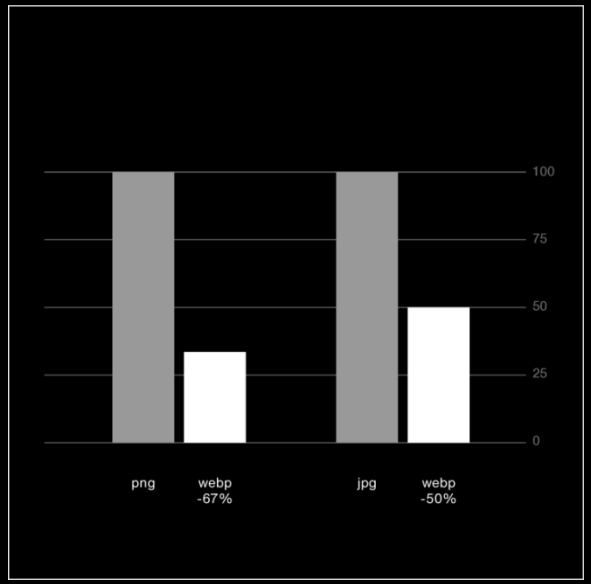

Size matters

Another initiative led by Google and which is becoming more common, allows you to sharply reduce the size of our images: WebP compression reduces the size of images from 30% up to 80% in comparison to standard JPEG and PNG formats.

Orange portals use illustrations converted into the WebP format to guarantee quick page loading that uses less energy.

To consume less energy/resource, please consider usage. For digital usage such as presentations and email transfers, use the web/small format download available from the brand site. For print use the original or large formats.

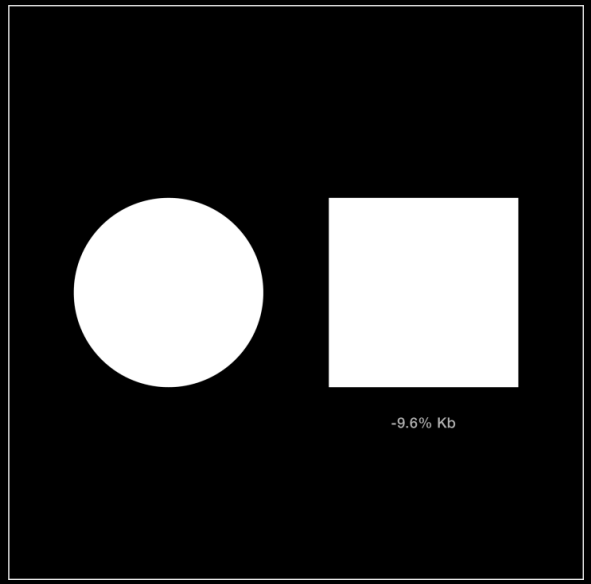

WebP: -30% KB to -80% KB

It’s square

Square and rectangular shapes use less data than round shapes because they can be adapted more easily to pixel grids on a screen.

Adopting a square style for interfaces, icons and other digital platforms allows you to save precious kilobytes.

Square design: -10% KB

Much simpler

Our interfaces are mainly square. From icons to navigation buttons by way of templates, our user interface style guide is dead square for a clear display, controlled information management and energy saving on screen displays.

Square UI style guide

Paper

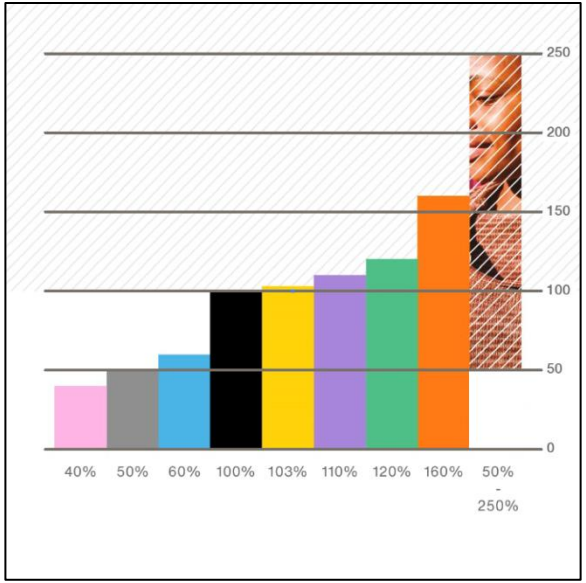

Make a good impression

All our public communications are printed with a four-colour process, from the 4 following inks: Cyan, Magenta, Yellow and Black (CMYK.)

During printing, these four inks are mixed by overlay. The ink coverage corresponds to the percentage of each colour on the paper. But the ink coverage varies depending on the colours and photos. The larger the ink coverage the more ink is needed but more importantly more chemicals to recycle these materials.

A good estimate before printing allows you to prevent making too many copies. On the other hand, doing lots of reprints won't allow you the economies of scale you need, or to limit the amount of dunnage machines and paper loss which can be as high as 10%, especially for small orders.

Conclusion: if we want to limit ink coverage as much as possible, we must either print text directly onto to the backing paper, or choose very light photos which require ink coverage below 100%.

Simpler and more pure

It’s uncommon to choose a visual based on its ink coverage, but you can optimise it significantly with simple actions.

By playing with contrasts, adding lighter areas and opting for a simple layout, ink consumption is reduced.

Give preference to simple layouts

Save ink

Each visual uses a specific amount of ink.

To limit ink use, we give preference to bright visuals, with soft, light and simple colours.

Limiting ink coverage offers several advantages:

- Ink which dries more quickly
- Sharper printing
- Cleaner deinking, fewer chemicals used to remove ink and recycle paper.

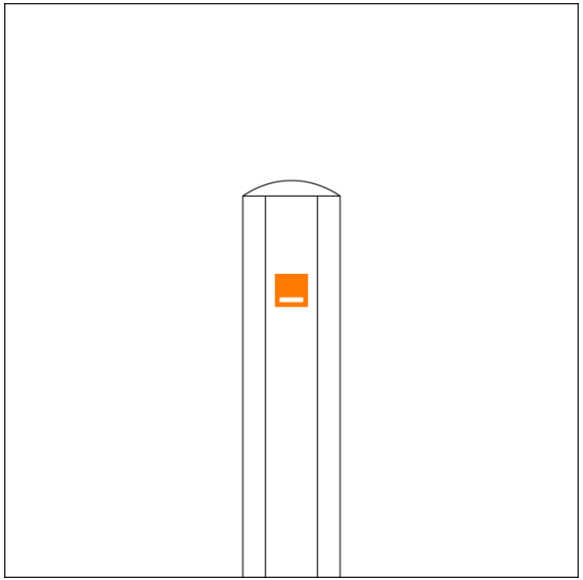

We avoid varnishes and metallic colours because they are more difficult to recycle.

Light and bright photos use less ink than dark photos

A greener Small logo

The Small logo has to be printed below 10mm. On small platforms, it uses 3.4% less ink than our Master logo.

Small logo Ink: -3.4 %

Cost-effective typefaces

Typefaces don’t all take up the same amount of space: some of them take up more than others. Their letters are larger, rounder or taller.

Choice of typeface can therefore have an impact on paper use.

Our Helvetica Now Variable font uses less paper than our old font Helvetica Neue.

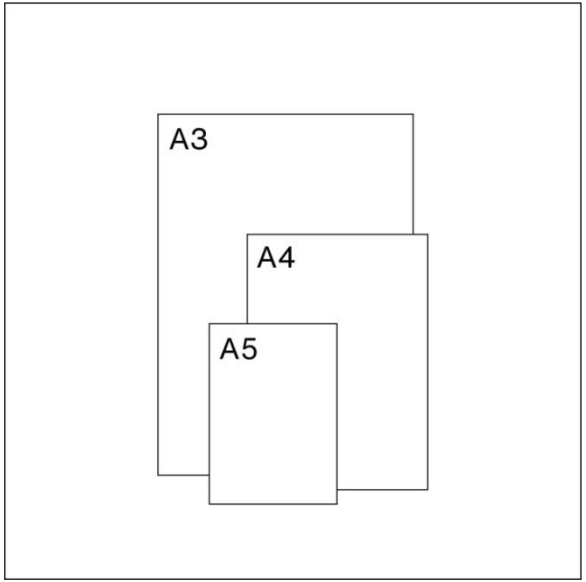

Standard sizes reduce waste

We use standard paper formats: A4, A5,A3 etc.

They limit paper waste and optimise the entire production line: printing, logistics and distribution.

They are compatible with standard packaging, box and envelope sizes.

Standard sizes reduce paper waste

Print

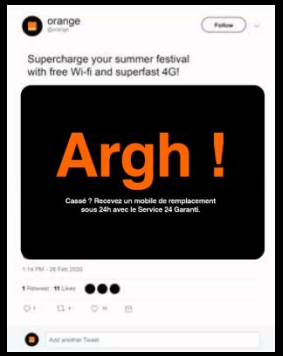

Digital platforms

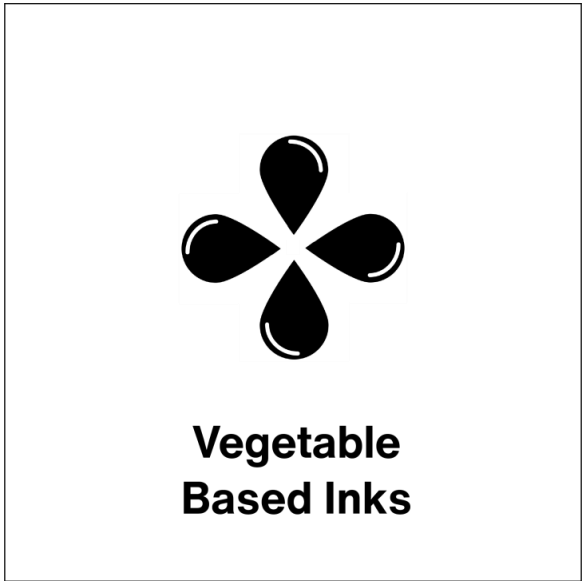

Vegan design

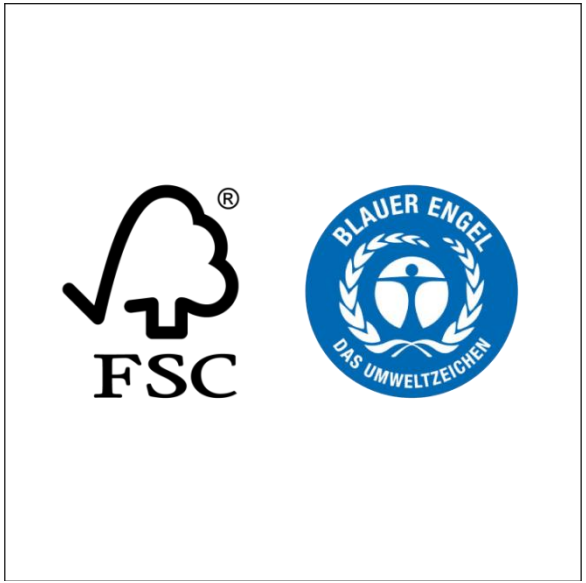

Choose so called ‘plant’ inks, which are less toxic and use renewable resources, instead of petrochemical mineral resources: we’re talking about ink ‘without mineral oil’ and ‘without cobalt.’ It is also advisable to ask for inks without palm oil (in accordance with the INGEDE 11 rule.) Avoid lamination and coating. To make things stand out, other methods can be explored, such as embossing or even laser cutting.

Inks without mineral oil

Recycled materials

Print on 100% recycled paper with the FSC or Blauer Engel label.

Recycling paper

Citeo reporting, green printing

In France, give preference to providers who consistently use the Citeo format. By receiving these reports centrally, Orange France's CSR department can then respond to our obligations for this organisation and work out our global financial contribution each year.

Or even pertain to the Imprim'Vert label. This label recognises printers who aim to limit the environmental impact of their work.

Citeo Report

Thanks
